

SCIENTIFIC PAPER

Title of the Scientific Paper

Optional subtitle

AUTHOR / GROUP

Author names

AFFILIATION / ROLE

Affiliations and ORCID identifiers

VERSION / DATE

Draft 0.1 · July 30, 2026

DOCUMENT STATUS

DRAFT / COMMUNITY REVIEW / RELEASED

IDENTIFIER

DOI, repository identifier, or document ID

LICENCE

CC BY 4.0

GenesisL1 templates encourage exact references, explicit provenance, reproducible methods where appropriate, and honest separation of evidence, interpretation, limitations, and future work. Use only the modules that serve the document.

Summary

State the research question, approach, principal result, and interpretation. Keep claims proportional to the evidence. Add keywords below when useful.

Keywords: keyword one; keyword two; keyword three.

SUGGESTED STATUS VOCABULARY

OBSERVED MEASURED DEMONSTRATED REPRODUCED INFERRED HYPOTHESISED
PROPOSED IN PROGRESS PLANNED

1 Introduction

Define the scientific context, the unresolved problem, and why the work matters.

CENTRAL QUESTION

What precise question, objective, or hypothesis guides this study?

2 Materials, data, and inputs

Describe samples, datasets, instruments, software, model versions, and inclusion criteria. Use exact identifiers where available.

3 Methods

Describe the design and analysis at the level needed for independent examination or reproduction. Distinguish preregistered steps from exploratory work.

Provenance and reproducibility

List repositories, content hashes, software commits, environment versions, dataset IDs, contract addresses, transaction references, or block heights when they materially improve reproducibility. None are mandatory when irrelevant.

4 Results

Report observations and analyses without mixing them unnecessarily with interpretation.

Evidence / observation

Insert the directly observed, measured, calculated, or implemented result.

5 Discussion

Interpret the results, compare them with prior work, and consider alternative explanations.

Interpretation

State the preferred interpretation and explain why it is presently warranted.

Limitations and uncertainty

Describe uncertainty, possible bias, unresolved assumptions, negative results, and limits on generalisation.

6 Relevance to verifiable scientific infrastructure

Optional. Explain whether exact data, model identity, deterministic execution, rights, or public provenance contribute to the work.

Verification boundary

A ledger may establish ordering, authorisation, byte commitments, provenance, or deterministic execution. It does not by itself establish data quality, scientific truth, biomedical validity, clinical safety, or correctness of interpretation.

7 Conclusion

Answer the central question at the level supported by the evidence and identify the next most informative test.

Author contributions

Use a recognised contribution taxonomy or a clear prose statement.

Data, code, ethics, and competing interests

Provide the relevant declarations. Sensitive or identifiable data should remain off-chain or use an appropriate protected architecture.
