Abstract

Background / Purpose. In one or two sentences, state the scientific need, the method or approach, the measured parameters, and the problem addressed.

Methods. State the number of subjects, specimens, datasets, simulations, or software systems and name the principal techniques.

Results. Use past tense. Report every numerical result required to support the conclusion, including uncertainty and exact sample sizes where relevant.

Conclusion. State the take-home message without introducing a new result or interpretation.

Keywords: keyword one; keyword two; keyword three

1 Introduction

Explain the general scientific need, the present state of knowledge, and the unresolved gap. Cite prior work constructively and accurately. State the hypothesis or central question clearly.

1.1 Aims

Number multiple aims when useful:

1. Determine ...
2. Compare ...
3. Evaluate ...

2 Methods

Write in past tense and follow the order: subjects or source population, investigated materials, experimental or computational methods, preprocessing, outcome measures, and statistics.

2.1 Subjects, materials, or datasets

Report inclusion and exclusion criteria, exact sample sizes, versions, and source identifiers.

2.2 Experimental or computational procedure

Describe the procedure at the level required for interpretation and independent reproduction.

2.3 Statistical analysis

State the estimand, statistical tests, one- or two-tailed design, exact n , definitions of replicates, uncertainty intervals, and decision thresholds.

Provenance and reproducibility

Record repositories, commits, containers, model versions, transaction identifiers, block heights, content hashes, or IPFS CIDs only when they materially improve independent inspection. These records do not replace a complete method description.

3 Results

Write in past tense. Follow the order of the figures and cite every figure in numerical order. Begin with exclusions, dropouts, failed runs, or successful completion counts, then report quantitative results.

EVIDENCE / OBSERVATION

State what was directly observed, measured, calculated, reconstructed, or executed. Support comparative words such as “higher”, “lower”, or “improved” with values, uncertainty, and statistical evidence where applicable.

4 Discussion

Begin with the overall meaning of the study. Explain the specific technical or conceptual novelty, compare the findings neutrally with prior work, and distinguish differences in methods, populations, materials, parameters, or conditions.

Recommended calibrated phrases include:

- ▶ “Our results provide evidence that ...” for a supported interpretation.
- ▶ “This observation points towards ...” for a preliminary

indication.

- “The findings are consistent with ...” when alternatives remain plausible.

Interpretation

State the interpretation separately from direct observation. Avoid presenting an interpretation as established fact.

Limitations and uncertainty

Although encouraging, this study has limitations. State them near the end of the Discussion and finish with a proportionate positive statement such as: “Despite these limitations, the consistency of the observed effect supports ...”

5 Conclusion

Summarise the take-home message. Do not introduce a new result or interpretation. The conclusion should remain consistent with the abstract.

Data and code availability

Describe access conditions, repository identifiers, licences, and embargoes. Use `\PrintGenesisArtifactRecord` when the structured record is useful.

Author contributions

Use the CRediT taxonomy or another explicit contribution statement.

Ethics, privacy, rights, and safety

Provide the declarations required by the field. Do not place personal data, regulated plaintext, private keys, credentials, or confidential information in public immutable state.

Competing interests and funding

State relevant financial, organisational, governance, founder, and commercial roles.

Acknowledgements

Keep acknowledgements factual and concise.

Template principle. A supportive container, not a Procrustean bed. Remove modules that do not serve the paper and add field-specific reporting requirements where appropriate.
